## Triangles <br> Level - 1 ( 1 MARK EACH)

Fill in the blanks:

1. All $\qquad$ .triangles are similar.
(Equilateral)
2. If a line divides two sides of a triangle in the same ratio, the line is $\qquad$ the third side.
(Parallel)
3. Sides of two similar triangles are in the ratio 4:9.The ratio of areas of these triangles is
$\qquad$ ...
4. Two triangle are said to be similar if. $\qquad$ (Corresponding sides are in same ratio and corresponding angles are equal)
5. Traingle have $\qquad$ .diagonals.
(No)
6. The six elements of a triangle are its three angles and the $\qquad$ (three sides)

## Level-2 (2 MARK EACH)

7. Find the length of $x$ in the following cases:

Ans.

$$
\begin{aligned}
& \mathrm{BC}^{2}=\mathrm{AB}^{2}+\mathrm{AC}^{2} \quad(\text { by Pythagoras theorem }) \\
& \mathrm{x}^{2}=5^{2}+12^{2} \\
& \mathrm{x}^{2}=25+144=169 \\
& \mathrm{x}=\sqrt{169} \\
& \mathrm{x}=13
\end{aligned}
$$

8. A Ladder 25 m long reaches a window of a building 20 m above the ground. Determine the distance of the foot of the ladder from the building.

## Downloaded from www.studiestoday.com

SOLUTION : suppose that $A B$ is a ladder, $B$ is the window and $C B$ is the building. Then, triangle ABC is right angle at C ,

$$
\begin{aligned}
& \mathrm{AB}^{2}=\mathrm{AC}^{2}+\mathrm{BC}^{2} \\
& 25^{2}=\mathrm{AC}^{2}+20^{2} \\
& \mathrm{AC}^{2}=625-400 \\
& =225 \\
& \mathrm{AC}=\sqrt{ } 225=15 \mathrm{~m}
\end{aligned}
$$

Hence, the foot of the ladder is at a distance 15 m from the building.
9. If $\Delta \mathrm{ABC} \sim \Delta \mathrm{DEF}$, such that $\mathrm{AB}=1.2 \mathrm{~cm}$, and $\mathrm{DE}=1.4 \mathrm{~cm}$. Find the ratio of areas of $\triangle \mathrm{ABC}$ and $\triangle \mathrm{DEF}$.
Ans. Ratio of Areas of similar triangle is equal to ratio of square of corresponding sides.
Therefore $\frac{\operatorname{ar} \triangle A B C}{\operatorname{ar} \triangle D E F}=A B^{2} / D E^{2}$

$$
\text { Or } \begin{aligned}
\frac{\operatorname{ar} \triangle A B C}{a r \triangle D E F} & =\left(\frac{1.2}{1.4}\right)^{2} \\
& =\frac{144}{196} \\
& =\frac{36}{49}
\end{aligned}
$$

10. If the areas of two similar triangles are equal, prove that they are congruent.

Ans.Let us take two triangles ABC and PQR with equal areas.
Then, we have;

$$
\frac{\operatorname{ar}(A B C)}{\operatorname{ar}(P Q R)}=\frac{1}{1}
$$

In this case;
$\frac{A B^{2}}{P Q^{2}}=\frac{A C^{2}}{P R^{2}}=\frac{1}{1}$

## Downloaded from www.studiestoday.com

$\frac{A B}{P Q}=\frac{A C}{P R}=\frac{1}{1}$
$\mathrm{AB}=\mathrm{PQ}$ and $\mathrm{AC}=\mathrm{PR}$
Angle $\mathrm{A}=$ angle P
Hence; the triangles are congruent.(BY SAS)

## Level - 3 ( 3 MARK EACH)

11. In $\triangle A B C, A B=A C=x, B C=5 \mathrm{~cm}$ and the area of the triangle $A B C$ is $15 \mathrm{~cm}^{2}$. Find x.

Ans.

Construction $\mathrm{AD} \perp \mathrm{BC}$ since $\triangle \mathrm{ABC}$ is an isosceles triangle therefore AD bisects BC i: $\mathrm{BD}=\mathrm{DC}=5 / 2$
Area of $\triangle \mathrm{ABC}=1 / 2 \mathrm{BC} \mathrm{X} \mathrm{AD}$
$=1 / 25 \mathrm{XAD}=1 / 2 \mathrm{X} 5 \mathrm{X} \sqrt{x^{2}-B D^{2}}$
$15=1 / 2 \times 5 \times \sqrt{x^{2}-B D^{2}}$
$\frac{15 \times 2}{5}=\sqrt{x^{2}-\left(\frac{5}{2}\right)^{2}}$
Squaring both sides
$36=\mathrm{x}^{2}-\frac{25}{4}$
$x^{2}=36+\frac{25}{4}$
$x=6.5$

## Alternative method

Area of $\triangle \mathrm{ABC}=1 / 2 \mathrm{BC} \mathrm{X} \mathrm{AD}$
$15=1 / 2 \times 5 \times \mathrm{AD}$
Or $\mathrm{AD}=30 / 5=6$
In right $\triangle \mathrm{ABD}$
$\mathrm{x}^{2}=36+\frac{25}{4}$ (by Pythagoras theorem)
$x=6.5$

## Downloaded from www.studiestoday.com

12. If $A D$ and $P M$ are medians of triangles $A B C$ and $P Q R$, respectively where $\triangle$ $\mathrm{ABC} \sim \triangle \mathrm{PQR}$, prove that $: \frac{A B}{P Q}=\frac{A D}{P M}$

## Solution:

$\frac{A B}{P Q}=\frac{B C}{Q R}$
$\frac{A B}{P Q}=\frac{2 B D}{2 Q M}$
In $\triangle \mathrm{ABD} \& \Delta \mathrm{PQM}$
$\frac{A B}{P Q}=\frac{B D}{Q M}$
Angle $B=$ Angle $Q$
$\triangle \mathrm{ABD} \sim \Delta \mathrm{PQM}$
Hence;

$$
\frac{A B}{A D}=\frac{P Q}{P M}
$$

(A side and the median of one triangle are in same ratio as a corresponding side and median of another triangle)

$$
\frac{A B}{P Q}=\frac{A D}{P M}
$$

Proved
13. A vertical pole of length 6 m casts a shadow 4 m long on the ground and at the same time a tower casts a shadow 28 m long. Find the height of the tower.

## Downloaded from www.studiestoday.com

## Solution:

Height of pole $=A B=6 \mathrm{~m}$ and its shadow $=B C=4 \mathrm{~m}$
Height of tower $=P Q=$ ? and its shadow $=Q R=28 \mathrm{~m}$
The angle of elevation of the sun will be same at a given time for both the triangles.
Hence; $\triangle \mathrm{ABC} \sim \triangle \mathrm{PQR}$
This means;
$\frac{A B}{A C}=\frac{P Q}{Q R}$
Or,$\frac{6}{4}=\frac{P Q}{28}$
Or, $P Q=\frac{6 \times 28}{4}=42 \mathrm{~m}$
Height of tower $=42 \mathrm{~m}$
14. $D$ is a point on the side $B C$ of a triangle $A B C$ such that $\angle A D C=\angle B A C$. Show that $\mathrm{CA}^{2}=\mathrm{CB} . C D$.

Solution: In $\triangle B A C$ and $\triangle A D C$;
$\angle B A C=\angle A D C$ (given)
$\angle \mathrm{ACB}=\angle \mathrm{DCA}$ (Common angle)
Hence; $\triangle \mathrm{BAC} \sim \triangle \mathrm{ADC}$
Hence;

## Downloaded from www.studiestoday.com

$\frac{C A}{C B}=\frac{C D}{C A}$
(corresponding sides are in same ratio)
Or, $C A \times C A=C B \times C D$
Or, $\mathrm{CA}^{2}=\mathrm{CB} \times \mathrm{CD}$ proved

## Level - 4 ( 4 MARK EACH)

15. In the given figure, $A B C$ and $D B C$ are two triangles on the same base $B C$. If AD intersects BC at O , show that $\frac{\operatorname{ar(ABC)}}{\operatorname{ar(DBC)}}=\frac{A O}{D O}$

Solution: Let us draw altitudes AM and DN on BC; respectively from A and D
$\frac{\operatorname{ar}(A B C)}{\operatorname{ar}(D B C)}=\frac{\frac{1}{2} \times B C \times A M}{\frac{1}{2} \times B C \times D N}$
$=\frac{A M}{D N}$
In $\triangle \mathrm{AMO}$ and $\triangle \mathrm{DNO}$;
$\angle \mathrm{AMO}=\angle \mathrm{DNO}$ (Right angle)
$\angle \mathrm{AOM}=\angle \mathrm{DON}$ (Opposite angles)
Therefore, $\triangle \mathrm{AMO} \sim \triangle \mathrm{DNO}$
Hence;

$$
\begin{aligned}
& \frac{A M}{D N}=\frac{A O}{D O} \\
& O r, \frac{\operatorname{ar}(A B C)}{\operatorname{ar}(D B C)}=\frac{A O}{D O}
\end{aligned}
$$

## Downloaded from www.studiestoday.com

16. $D, E$ and $F$ are respectively the mid-points of sides $A B, B C$ and $C A$ of $\triangle A B C$. Find the ratio of the areas of $\triangle D E F$ and $\triangle A B C$.

Since $D, E$ and $F$ are mid points of $A B, B C$ and $A C$
Hence; $\triangle B A C \sim \triangle D F E$
So,

$$
\frac{D F}{B C}=\frac{E F}{A B}=\frac{D E}{A C}=\frac{1}{2}
$$

So,

$$
\frac{\operatorname{ar}(D E F)}{\operatorname{ar}(A B C)}=\frac{1^{2}}{2^{2}}=\frac{1}{4}
$$

17. Prove that the area of an equilateral triangle described on one side of a square is equal to half the area of the equilateral triangle described on one of its diagonals.

Solution: : Let us take a square with side ' $a$ ' Then the diagonal of square will be a $\sqrt{2}$ Area of equilateral triangle with side ' $a$ '

$$
=\frac{\sqrt{3}}{4} a^{2}
$$

Area of equilateral triangle with side a $\sqrt{2}$
$=\frac{\sqrt{3}}{4}(a \sqrt{2})^{2}$

Ratio of two areas can be given as follows:
$\frac{\frac{\sqrt{3}}{4} \times a^{2}}{\frac{\sqrt{3}}{4} \times 2 a^{2}}=\frac{1}{2}$
18. The perpendicular from $A$ on side $B C$ of $\triangle A B C$ intersect $B C$ at $D$ such that $\mathrm{DB}=3 \mathrm{CD}$. Prove that

$$
2 \mathrm{AB}^{2}=2 \mathrm{AC}^{2}+\mathrm{BC}^{2}
$$

Ans:

Proof: $\mathrm{AD} \perp \mathrm{BC}$
DB=3CD
$B C=D B+C D=3 C D+C D=4 C D$
$\mathrm{CD}=\frac{1}{4} \mathrm{BC}, \mathrm{DB}=\frac{3}{4} \mathrm{BC}$

In rt $\triangle \mathrm{ABD} ; \mathrm{AB}^{2}=\mathrm{AD}^{2}+\mathrm{BD}^{2}$
$\mathrm{AB}^{2}=\mathrm{AD}^{2}+\left(\frac{3}{4} B C\right)^{2}$
$\mathrm{AB}^{2}=\mathrm{AD}^{2}+\frac{9}{16} B C^{2}$

In rt $\triangle \mathrm{ACD}, \mathrm{AC}^{2}=\mathrm{AD}^{2}+\mathrm{CD}^{2}$
$=\mathrm{AD}^{2}+\left(\frac{1}{4} B C\right)^{2}$
$=\mathrm{AD}^{2}+\frac{1}{16} B C^{2}$
$\mathrm{AB}^{2}-\mathrm{AC}^{2}=\frac{1}{2} B C^{2}$
$2 \mathrm{AB}^{2}-2 \mathrm{AC}^{2}=\mathrm{BC}^{2}$
$2 \mathrm{AB}^{2}=2 \mathrm{AC}^{2}+\mathrm{BC}^{2}$
