## LEVEL-1 QUESTIONS

### 2.1 What are solns?

Homogeneous mixture containing two or more than two components.

### 2.2 What are binary solns?

Binary solution : Solutions containing only two components.

### 2.3.Define mole fraction

Ratio of number of moles of a component to the total number of moles of solutions.

### 2.4 Define molarity

Number of moles of solute dissolved in one litre of solution.

### 2.5 Define molality

Number of moles of the solute dissolved in 1 kg of the solvent.

### 2.6. State Henry's law

The partial pressure of the gas in vapour phase is directly proportional to the molefraction of the gas in the solution.

$$
P=K_{H} X
$$

### 2.7. Mention one application of Henry's law

To increase the solubility of $\mathrm{CO}_{2}$ in soft drinks, the bottle is sealed under high pressure.

### 2.8. State Raoutlt's Law

For a solution of volatile liquids, the partial vapour pressure of each component in the solution is directly proportional to its mole fraction.

$$
\mathrm{P}_{1}=\mathrm{p}^{0}{ }_{1} \mathrm{x}_{1}
$$

### 2.9. What are Ideal solutions?

Solutions which obey Raoult's law . solute -solvent interaction is nearly equal to solute -solute or solvent - solvent interaction. $\Delta_{\text {mix }} \mathrm{H}=0$ and $\Delta_{\text {mix }} \mathrm{V}=0$
Eg: n- hexane and n-heptane

### 2.10. What are non-ideal solutions?

Solutions which do not obey Raoult's law. Inter molecular force of attraction between solute solvent is Weaker or stronger than those between solute -solute or solvent - solvent interaction.

$$
\Delta_{\text {mix }} \mathrm{H} \neq 0 \quad \Delta_{\text {mix }} \mathrm{V} \neq 0
$$

Positive deviation: Solutions which do not obey Raoult's law. Inter molecular force of attraction between solute -solvent is Weaker than those between solute -solute or solvent - solvent interaction. Molecule find it easier to escape than in pure state. This will increase the vapour pressure and results positive deviation. $\Delta_{\text {mix }} \mathrm{H}=+$ ive $\Delta_{\text {mix }} \mathrm{V}=+$ ive eg. Mixtureof ethanol and water.

Negative deviation: Solutions which do not obey Raoult's law. Inter molecular force of attraction between solute -solvent is stronger than those between solute -solute or solvent solvent interaction due to the formation of H -bonding in between solute and solvent. This decreases escaping tendency of molecules and its decreases the vapour pressure and results negative deviation.

### 2.12. Define colligative property

Properties which depend on the number of solute particle irrespective of their nature relative to the total number of particle present in the solution.

### 2.13. Define Ebullioscopicconstant

Elevation of boiling point of one molal solution.

### 2.14. Define Cryoscopic constant

Depression of freezing point of one molal solution.

### 2.15. Define Osmosis

Flow of solvent molecule through semi permeable membrane from pure solvent to the solution. This process of flow of the solvent is called osmosis.

### 2.16. Define Osmotic Pressure

Excess pressure that must be applied to a solution to prevent osmosis.

### 2.17. What is reverse osmosis

Pure solvent flows out of the solution through the semi permeable membrane when we apply pressure larger than the osmotic pressure. Application of reverse osmosis is desalination of seawater.

### 2.18. What are isotonic solution

Two solutions having same osmotic pressure at a given temperature.

### 2.19. Define van't Hoff factor

$\mathrm{i}=$ Normal molar mass / abnormal molar mass
$\mathrm{i}=$ observed colligative property / calculated colligative property.
2.20. All formulas - Calculation of Molar mass using colligative property $\frac{\mathrm{p}_{\mathrm{A}}^{0}--\mathrm{p}}{\mathrm{p}_{\mathrm{A}}^{0}} \approx \frac{\mathrm{n}_{\mathrm{B}}}{\mathrm{n}_{\mathrm{A}}}=\frac{\mathrm{w}_{\mathrm{B}} / \mathrm{M}_{\mathrm{B}}}{\mathrm{w}_{\mathrm{A}} / \mathrm{M}_{\mathrm{A}}}$

$$
\pi V=\frac{w 2 R T}{M 2}
$$

## LEVEL-2 QUESTIONS.

2.1. Concentrated nitric acid used in the laboratory work is $\mathbf{6 8 \%}$ nitric acid by mass in aqueous solution. What should be the molarity of such a sample of the acid if the density of solution is $1.504 \mathrm{~g} \mathrm{~mL}^{-1}$ ?
Sol. Percentage mass (\%) and molarity (M) of the solution are related as

$$
\begin{aligned}
\text { Molarity }(\mathrm{M})= & \frac{\% \text { mass } \times \text { density } \times 10}{\text { Molar mass of solute }\left(\mathrm{HNO}_{3}\right)} \\
& =\frac{68 \times 1.504\left(\mathrm{~g} \mathrm{~mL}^{-1}\right) 10}{68\left(\mathrm{~g} \mathrm{~mol}^{-1}\right)}=16.23 \mathrm{M}
\end{aligned}
$$

2.2. Calculate the percentage composition in terms of mass of a solution obtained by mixing 300 g of a $25 \%$ and 400 g of a $\mathbf{4 0 \%}$ solution by mass.
Sol. Mass of solute in 300 g of $25 \%$ solution $=75 \mathrm{~g}$
Mass of solute in 400 g of $40 \%$ solution $=160 \mathrm{~g}$
Total mass of solute

$$
=(75+160) \mathrm{g}=235 \mathrm{~g}
$$

Total mass of solution

$$
=700 \mathrm{~g}
$$

$\%$ of solute in final solution $=\frac{235 \times 100}{700}=33.2 \%$
$\%$ of water in final solution $=100-33.5=66.5 \%$
2.3. An antifreeze solution is prepared from 222.6 g of ethylene glycol $\left(\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O}_{2}\right)$ and 200 g of water. Calculate the molality of the solution. If the density of the solution is 1.072 g $\mathbf{m L}^{-1}$ then what shall be the molarity of the solution ?
Sol. Molality $(\mathbf{m})=\frac{\mathrm{W}_{\mathrm{B}} \times 10^{3}}{\mathrm{MM}_{\mathrm{B}} \times \mathrm{W}_{\mathrm{A}}}=\frac{222.6 \times 1000}{62 \times 260}$

$$
=17.95 \mathrm{~mol} \mathrm{~kg}^{-1}
$$

Total mass of solution $=200+222.6=422.6 \mathbf{k g}$
Vol. of solution $=\frac{\text { Mass }}{\text { Density }}=\frac{422.6(\mathrm{~g})}{1.072\left(\mathrm{~g} \mathrm{~mol}^{-1}\right)}=\mathbf{3 9 4 . 2 2 2}$
Molarity $(\mathbf{M})=\frac{W_{B} \times 10^{3}}{M M_{B} \times V_{(m l)}}=\frac{222.6(\mathrm{~g}) \times 10^{3}(\mathrm{~mL})}{62\left(\mathrm{~g} \mathrm{~mol}^{-1}\right) \times 394.22(\mathrm{~mL})}$

$$
=9.107 \mathrm{~mol} \mathrm{~L}^{-1}
$$

2.4. A sample of drinking water was found to be severely contaminated with chloroform, $\mathrm{CHCl}_{3}$, supposed to be carcinogen. The level of contamination was 15 ppm (by mass)
(i) Express this in percent by mass.
(ii) Determine the molality of chloroform in the water sample.

Sol. Mass of solution $\left(w_{A}+w_{B}\right)=10^{6} g$

$$
\text { Mass of solute }(\mathrm{wb}) \quad=15 \mathrm{~g}
$$

$$
\% \text { mass }=\frac{w_{B} \times 100}{w_{A}+w_{B}}=\frac{15 \times 100}{10^{6}}=1.5 \times 10^{-3} \%
$$

Mass of solvent $\left(\mathrm{w}_{\mathrm{A}}\right)=10^{6}-15=999985 \mathrm{~g}$

$$
\begin{aligned}
& \operatorname{Molality}(\mathbf{m})= \frac{\mathrm{w}_{\mathrm{B}} \times 10^{3}}{\mathrm{MM}_{\mathrm{B}} \times \mathrm{w}_{\mathrm{A}}}=\frac{15(\mathrm{~g}) \times 10^{3}(\mathrm{~g})}{119.5\left(\mathrm{~g} \mathrm{~mol}^{-1}\right) \times 999985 \mathrm{~g}} \\
&=\mathbf{1 . 2 5} \times \mathbf{1 0}^{-4} \mathbf{~ m}
\end{aligned}
$$

2.5. What role does the molecular interaction play in solution of alcohol and water The intermolecular forces both in alcohol and water are H -bonds. When alcohol ( ROH ) and water $\left(\mathrm{H}_{2} \mathrm{O}\right)$ are mixed. They form solution because of formation of H -bonds between alcohol and $\mathrm{H}_{2} \mathrm{O}$ molecules but these interactions are weaker and less extensive positive deviation from Raoult's law with both, $\Delta \mathrm{H}_{\text {mix }}$ and $\Delta \mathrm{V}_{\text {mix }}>0$. The solution will have higher vapour pressure and lower boiling point than the individual components.
2.6. Why does gases nearly always tend to be less soluble in liquids as the temperature is raised?
Dissolution of gases is exothermic process. It is because of the fact that this process involves decrease of entropy ( $\Delta \mathrm{S}<0$ ). Thus, increase of temperature tends to push the equilibrium, $($ Gas + Solvent $=$ Solution; $\Delta \mathrm{H}=-\mathrm{ve})$ in the backward direction, thereby, suppressing the dissolution.
2.7. The partial pressure of ethane over a saturated solution containing $6.56 \times 10^{-2} \mathrm{~g}$ of ethane is 1 bar. If the solution contains $5.00 \times 10^{-2} \mathrm{~g}$ of ethane, then what shall be the partial pressure of the gas.
Sol. According to Henry's law, $m=K_{H} p$

$$
\mathrm{K}_{\mathrm{H}}=\frac{\mathrm{m}}{\mathrm{p}}=\frac{6.56 \times 10^{-2}(\mathrm{~g})}{1(\mathrm{bar})}=6.56 \times 10^{-2} \mathrm{~g} \mathrm{bar}^{-1}
$$

In the second case,

$$
\mathbf{p} \frac{\mathrm{m}}{\mathrm{~K}_{\mathrm{H}}}=\frac{5.00 \times 10^{-2}(\mathrm{~g})}{6.56 \times 10^{-2}\left(\mathrm{~g} \mathrm{bar}^{-1}\right)}=76.21 \mathrm{bar}
$$

2.8. An aqueous solution of 2 percentnonvolatile solute exerts a pressure of 1.004 bar at the boiling point of the solvent. What is the molecular mass of the solute?
Sol. The vapour pressure of pure water

$$
\left(p_{A}^{0}\right)=1 \mathrm{ATM}=1.013 \mathrm{BAR}
$$

Vapour pressure of solution $(p)=1.004$ bar

$$
\mathrm{w}_{\mathrm{B}}=2 \mathrm{~g} ; \quad \mathrm{w}_{\mathrm{A}}+\mathrm{w}_{\mathrm{B}}=100 \mathrm{~g} ; \quad \mathrm{w}_{\mathrm{A}}=98 \mathrm{~g}
$$

Now $\quad \frac{p_{A}^{0}--p}{p_{A}^{0}} \approx \frac{n_{B}}{n_{A}}=\frac{w_{B} / M_{B}}{w_{A} / M_{A}}$
or

$$
\begin{gathered}
\mathbf{M}_{\mathbf{B}}=\frac{w_{B} M_{A}}{w_{A}\left(\Delta p / p_{A}^{0}\right)}=\frac{2 \times 18 \times 1.013}{98 \times(1.013-1.004)} \\
=\mathbf{4 1 . 3 5} \mathbf{g ~ m o l}^{-1}
\end{gathered}
$$

2.9. The vapour pressure of water is 12.3 kPa is 300 K . Calculate the vapour pressure of 1 molal solution of a solute in it.
Sol.

$$
\mathrm{p}_{\mathrm{H}_{2} \mathrm{O}}^{0}=12.3 \mathrm{kPa}
$$

In 1 molal solution,

$$
\begin{aligned}
& \quad \mathbf{n}_{\mathbf{B}}=\mathbf{1} ; \quad \mathrm{n}_{\mathrm{H}_{2} \mathrm{O}}=\frac{1000}{18}=\mathbf{5 5 . 5} \\
& \therefore \mathrm{x}_{\mathrm{H}_{2} \mathrm{O}}=\frac{55.5}{55.5+1}=0.982 \\
& \quad \mathbf{p}=\mathbf{0 . 9 8 2} \times \mathbf{1 2 . 3}=\mathbf{1 2 . 0 8} \mathbf{~ k P a} .
\end{aligned}
$$

2.10. Calculate the mass of a nonvolatile solute (molecular mass 40) which should be dissolved in 114 g octane to reduce its vapour pressure to $\mathbf{8 0 \%}$.
Sol. Vapour pressure of solution $(\mathbf{p})=\mathbf{8 0 \%}$ of $p_{A}^{0}=\mathbf{0 . 8} p_{A}^{0}$
Let the mass of solute be $w g$

$$
\therefore \quad \text { Moles of solute }=\frac{\mathrm{w}}{40}
$$

Mole of octane (no) $=\frac{114}{114}=\mathbf{1} \mathbf{~ m o l}$

$$
\mathbf{x}_{\mathbf{B}}=\frac{\mathrm{w} / 40}{(w / 40)+1}
$$

$$
\text { Now, } \frac{\Delta p}{p^{\circ}}=x_{B} \quad \text { or } \quad \frac{p^{\circ}-0.8 p^{\circ}}{p^{\circ}}=\frac{w / 40}{(w / 40)+1}
$$

or

$$
\mathbf{w}=\frac{0.2 \times 40}{0.8}=\mathbf{1 0} \mathbf{g}
$$

2.11. A $5 \%$ solution (by mass) of cane sugar in water has freezing point of 271 K . Calculate the freezing point a $5 \%$ glucose in water if freezing point of pure water is 273.15 K .
Sol. Molality of sugar solution $=\frac{5(\mathrm{~g}) \times 1000\left(\mathrm{~g} \mathrm{~kg}^{-1}\right)}{342\left(\mathrm{~g} \mathrm{~mol}^{-1}\right) \times 100(\mathrm{~g})}=\mathbf{0 . 1 4 6} \mathbf{~ m o l ~ k g}{ }^{-1}$

$$
\Delta \mathrm{T}_{\mathrm{f}}=273.15-271=2.15^{\circ}
$$

Now,

$$
\Delta \mathbf{T}_{f}=K_{f} \times \mathbf{m} \quad \text { or } \quad K_{f}=\frac{\Delta T_{f}}{m}=\frac{2.15}{0.146}=\mathbf{1 4 . 7 2 6}
$$

Molality of glucose solution

$$
\begin{aligned}
&= \frac{5(\mathrm{~g}) \times 1000\left(\mathrm{~g} \mathrm{~kg}^{-1}\right)}{180\left(\mathrm{~g} \mathrm{~mol}^{-1}\right) \times 100(\mathrm{~g})}=\mathbf{0 . 2 7 8} \mathbf{~ m o l ~ k g} \\
&-1 \\
& \Delta \mathbf{T}_{\mathbf{f}}=\mathbf{K}_{\mathbf{f}} \mathbf{m}=\mathbf{1 4 . 7 2 6} \times \mathbf{0 . 2 7 8}=\mathbf{4 . 0 9}
\end{aligned}
$$

Freezing point of glucose solution

$$
=273.15-4.09=269.06 \mathrm{~K}
$$

2.12. At $300 \mathrm{~K}, 36 \mathrm{~g}$ of glucose present per litre in its solution has an osmotic pressure of 4.98 bar. If the osmotic pressure of solution is 1.52 bar at the same temperature. What would be its concentration?
Sol. In $1^{\text {st }}$ case $\pi_{1}=$ CRT
or

$$
\begin{equation*}
4.98=\frac{36 \times R \times 300}{180} \tag{i}
\end{equation*}
$$

In $2^{\text {nd }}$ case $1.52=\mathbf{C} \times \mathbf{R} \times 300$
Divided (ii) by (i)

$$
\frac{1.52}{4.98}=\frac{C \times R \times 300 \times 180}{36 \times R \times 300}
$$

or

$$
\mathrm{C}=0.061 \mathrm{~mol} \mathrm{~L}^{-1}
$$

2.13. Amongst the following compounds, identify which are insoluble, partially soluble and highly soluble in water:
(i) phenol
(ii) toluene
(iii) formic acid
(iv) ethylene glycol
(v) chloroform
(vi) pentanol.

Sol. Water is a polar substance and the intermolecule forces in water are H -bonds.
(a) Toluene $\left(\mathrm{C}_{6} \mathrm{H}_{5}-\mathrm{CH}_{3}\right)$ and chloroform $\left(\mathrm{CHCl}_{3}\right)$ are insoluble in water as they cannot form H -bonds with $\mathrm{H}_{2} \mathrm{O}$ molecules
(b) Phenol $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}\right)$ and pentanol $\left(\mathrm{C}_{5} \mathrm{H}_{11} \mathrm{OH}\right)$ are partially miscible with water because of very weak solute solvent interactions due to the significant non-polar part (aryl or alkyl) in their molecules.
(c) Formic acid $\left(\mathrm{CH}_{3} \mathrm{COOH}\right)$ and ethylene glycol $\left(\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{OH})_{2}\right)$ are highly soluble because of their strong tendency of formic H -bonds with water molecules.
2.14. Based on solute-solvent interactions arrange the following in order of increasing solubility in n-octane and explain: Cyclohexane, $\mathrm{KCl}, \mathrm{CH}_{3} \mathrm{OH}, \mathrm{CH}_{3} \mathrm{CN}$.
n-octane is non-polar substance. Following the principle of like dissolves like, the solubility increases as the polarity of the solute decreases. Thus, among the given substances the solubility in n-octane increases as $\mathrm{KCl}<\mathrm{CH}_{3} \mathrm{OH}<\mathrm{CH}_{3} \mathrm{CN}<$ Cyclohexane.
2.15. Calculate the percentage of aspirin $\left(\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}\right)$ in acetonitrile $\left(\mathrm{CH}_{3} \mathrm{CN}\right)$ when 6.5 g of $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}$ is dissolved in 450 g of $\mathrm{CH}_{3} \mathrm{CN}$.
Sol. $\quad$ Mass $\%=\frac{W_{B} \times 100}{W_{A}+W_{B}}=\frac{6.5 \times 100}{6.5 \times 450}=\mathbf{1 . 4 2 4 \%}$
2.16. Calculate the amount of benzoic acid $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}\right)$ required for preparing 250 mL of 0.15 M solution in methanol.

Sol. $\quad \mathbf{M}=\frac{W_{B} \times 1000}{(M M)_{B} \times V}$
or $\quad W_{B}=\frac{M \times(M M)_{B} \times V}{1000}$
$=0.15\left(\mathrm{~mol} \mathrm{~L}^{-1}\right) \times 122\left(\mathrm{~g} \mathrm{~mol}^{-1}\right) \times 250 \times 10^{-3}(\mathrm{~L})=4.575 \mathrm{~g}$
2.17. The depression in freezing point of water observed for the same amount of acetic acid, trichloroacetic acid and trifluoroacetic acid increases in the order given above. Explain briefly
Colligative property is directly proportional to the concentration of solute articles which further depends upon the degree of dissociation of electrolytes. Now, the strength of acid and its corresponding degree of ionization increases as

$$
\mathrm{H}_{3} \mathrm{C}-\mathrm{COOH}<\mathrm{Cl}_{3} \mathrm{C}-\mathrm{COOH}<\mathrm{F}_{3} \mathrm{C}-\mathrm{COOH}
$$

Consequently, the concentration of solute particles and thus, the value of $\Delta \mathrm{T}_{\mathrm{f}}$ increases in the same order.
2.18. Vapour pressure of water at 298 K is $\mathbf{1 7 . 5 3 5} \mathbf{~ m m ~ H g}$. Calculate vapour pressure of water at 293 K when 25 g of glucose is dissolved in 450 g of water.
Sol. $\quad p_{A}^{0}=\mathbf{1 7 . 5 3 5} \mathbf{~ m m ~ H g}$. Let vapour pressure of solution be $p_{s}$

$$
\begin{aligned}
\frac{p_{A}^{0}-p_{s}}{p_{A}^{0}} & =x_{B} \quad \text { or } \quad \mathbf{1}-\frac{p_{s}}{p_{A}^{0}}=\mathbf{x B} \text { or } p_{s}=p_{A}^{0}\left(1-x_{B}\right) \\
p_{s} & =p_{A}^{0} \times x_{A}=\mathbf{1 7 . 5 3 5} \times \frac{450 / 18}{25 / 180+450 / 18} \\
& =\mathbf{1 7 . 5 3 5} \times \mathbf{0 . 9 9 4 5}=\mathbf{1 7 . 4 3 8} \mathbf{~ m m ~ H g} \\
& \approx \quad \mathbf{1 7 . 4 4} \mathbf{~ m m ~ H g} .
\end{aligned}
$$

or
2.19. Henry's law constant for the molarity of methane in benzene at 298 K is $4.27 \times 10^{5} \mathrm{~mm}$ Hg. Calculate the solubility of methane in benzene at 298 K under 760 mm Hg .
Sol. $\quad K_{H}=4.27 \times 10^{5} \mathrm{~mm}$,
According to Henry's law, $\mathbf{p}=\mathbf{K H}_{\mathbf{H}} . \mathbf{x}_{\mathrm{CH}_{4}}$

Or

$$
\mathrm{x}_{\mathrm{CH}_{4}}=\frac{\mathrm{p}}{\mathrm{~K}_{\mathrm{H}}}=\frac{760(\mathrm{mmHg})}{4.27 \times 10^{5}(\mathrm{mmHg})}=1.78 \times 10^{-3}
$$

2.20. Determine the amount of $\mathbf{C a C l}_{2}(\mathbf{i}=2.47)$ dissolved in 2.5 litre of water such that its osmotic pressure is 0.75 atm at $27^{0} \mathrm{C}$.
Sol. $\pi=\mathbf{i C R T}$ or $\pi=\frac{i \times W_{B} \times R \times T}{(M M)_{B} \times V_{(L)}}$ or $W_{B}=\frac{\pi \times(M M)_{B} \times V_{(L)}}{i \times R \times T}$

$$
=\frac{0.75(\mathrm{~atm}) \times 111\left(\mathrm{~g} \mathrm{~mol}^{-1}\right) \times 2.5(\mathrm{~L})}{2.47 \times 0.0821\left(\mathrm{~L} \mathrm{~atm} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right) \times 300.15(\mathrm{~K})}
$$

$=3.40 \mathrm{~g}$

$$
\text { or } \quad \frac{3.40(\mathrm{~g})}{111\left(\mathrm{~g} \mathrm{~mol}^{-1}\right)}=\mathbf{0 . 0 3} \mathrm{mol} .
$$

## LEVEL-3 QUESTIONS

2.1 Heptane and octane form ideal solution. At 373 K , the vapour pressure of the two liquid components are 105.2 kPa and 46.8 kPa , respectively. What will be the vapour pressure, in bar, of a mixture of 25.0 g of heptane and 35.0 g of octane?
Sol. $\quad$ Moles of haptane $\left(\mathbf{n}_{\mathbf{H}}\right)=\frac{25}{100}=\mathbf{0 . 2 5}$

$$
\text { Moles of octane }\left(\mathrm{n}_{\mathrm{o}}\right)=\frac{35}{114}=0.307
$$

$\mathbf{x}_{\mathrm{H}}=\frac{0.25}{0.25+0.307}=\frac{0.25}{0.557}=\mathbf{0 . 4 4 9} ; \mathbf{x} \mathbf{0}=\mathbf{1}-\mathbf{0 . 4 4 9}=\mathbf{0 . 5 5 1}$
Vapour pressure of heptane $(\mathbf{p н})=105.2 \times 0.449=47.2348 \mathrm{kPa} \approx 47.235 \mathrm{kPa}$
Vapour pressure of octane $(\mathbf{p o})=46.8 \times 0.551=25.787 \mathrm{kPa}$
Total vapour pressure $P_{\text {total }}=\mathbf{p H}+\mathbf{p o}=47.235+25.787=73.022 \mathbf{k P a}$
Or $\quad \frac{73.022 \times 10^{3}}{10^{5}}$ bar $=\mathbf{0 . 7 3 0 2}$ bar.
2.2 2.2. A solution of glucose in water is labelled as 10 percent $w / w$. What would be the molality and mole fraction of each component in the solution? If the density of the solution is $1.2 \mathrm{~g} \mathrm{~mL}^{-1}$, then what shall be the molarity of the solution?
Sol. $\quad$ Molarity $(\mathbf{M})=\frac{\% \times \mathrm{d} \times 10}{\text { Molar mass(glucose) }}$

$$
=\frac{10 \times 1.2\left(\mathrm{~g} \mathrm{~mol}^{-1}\right) \times 10}{180\left(\mathrm{~g} \mathrm{~mol}^{-1}\right)}=\mathbf{0 . 6 7} \mathbf{~ M}
$$

Consider 100 g of solution.
Mass of glucose $=\mathbf{1 0} \mathbf{g}$; mole of glucose $\left(\mathrm{n}_{\mathrm{B}}\right)=10 / 180$
Mass of water $=90 \mathrm{~g}$; $\mathbf{~ m o l}$ of water $\left(\mathrm{n}_{\mathrm{A}}\right)=\frac{90}{18}=5 \mathrm{~mol}$
Molality $(\mathbf{m})$ of solution $=\frac{10 / 180}{90 \times 10^{-3}}=\mathbf{0 . 6 1 7} \mathbf{~ M}$
Mole fraction of glucose

$$
\left(\mathbf{x}_{\mathbf{B}}\right)=\frac{10 / 180}{5+10 / 180}=\frac{0.055}{5.05}=\mathbf{0 . 0 1}
$$

Mole fraction of water $\left(\mathrm{x}_{\mathrm{A}}\right)=1-\mathbf{0 . 0 1}=\mathbf{0 . 9 9}$
2.3 How many mL of a 0.1 M HCl are required to react completely with 1 g mixture of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and $\mathrm{NaHCO}_{3}$ containing equimolar amounts of two?
Sol. Let $\mathrm{Na}_{2} \mathrm{CO}_{3}$ be $\mathrm{x} g$
$\therefore \quad \mathrm{Mol}$ of $\mathrm{Na}_{2} \mathrm{CO}_{3}\left(\mathbf{n}_{1}\right)=\frac{\mathrm{x}}{106}$ mol

$$
\begin{aligned}
& \mathrm{NaHCO}_{3}=(1-\mathbf{x}) \mathrm{g} \\
\therefore \quad & \mathrm{Mol}^{\prime} \mathrm{NaHCO}_{3}\left(\mathbf{n}_{2}\right)=\frac{(1-\mathrm{x})}{84} \mathrm{~mol}
\end{aligned}
$$

$\underset{\text { 1mole }}{\mathrm{Na}_{2} \mathrm{CO}_{3}}+\underset{2 \mathrm{~mol}}{2 \mathrm{HCl}} \longrightarrow \mathrm{NaCl}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
$\underset{1 \text { mole }}{\mathrm{NaHCO}_{3}}+\underset{1 \mathrm{~mol}}{\mathrm{HCl}} \longrightarrow \mathrm{NaCl}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
HCl required for $\frac{x}{106}$ mol of $\mathrm{Na}_{2} \mathrm{CO}_{3}=\frac{2 x}{106} \mathrm{~mol}$
HCl required for $\frac{(1-x)}{84}$ mol of $\mathrm{NaHCO}_{3}=\frac{(1-x)}{84} \mathrm{~mol}$
Since given mixture contains equimolar amount
$\therefore \quad \frac{x}{106}=\frac{(1-x)}{84} \quad$ or $\quad \mathbf{x}=\mathbf{0 . 5 6}$
Total HCl required $=\left[\frac{2 x}{106}+\frac{1-x}{84}\right]=\frac{2 \times 0.56}{106}+\frac{1-0.56}{84}$

$$
=0.01578 \mathrm{~mol}
$$

If V is the volume of HCl required, then

$$
V_{(L)} \times 0.1=0.01578
$$

or

$$
V_{L}=0.1578 L \quad \text { or }
$$

$$
157.8 \mathrm{~mL}
$$

2.4 Heptane and octane form ideal solution. At 373 K , the vapour pressure of the two liquid components are 105.2 kPa and 46.8 kPa , respectively. What will be the vapour pressure, in bar, of a mixture of 25.0 g of heptane and 35.0 g of octane?
Sol. $\quad$ Moles of haptane $\left(\mathbf{n}_{\mathbf{H}}\right)=\frac{25}{100}=\mathbf{0 . 2 5}$
Moles of octane (no) $=\frac{35}{114}=\mathbf{0 . 3 0 7}$

$$
\mathbf{x H}_{\mathbf{H}}=\frac{0.25}{0.25+0.307}=\frac{0.25}{0.557}=\mathbf{0 . 4 4 9} ; \mathbf{x} \mathbf{0}=\mathbf{1}-\mathbf{0 . 4 4 9}=\mathbf{0} .551
$$

Vapour pressure of heptane $\left(\mathbf{p H}^{\prime}\right)=105.2 \times 0.449=47.2348 \mathrm{kPa} \approx 47.235 \mathrm{kPa}$
Vapour pressure of octane $(\mathrm{po})=46.8 \times 0.551=25.787 \mathrm{kPa}$
Total vapour pressure $\mathbf{P}_{\text {total }}=\mathbf{p H}_{\mathbf{H}}+\mathbf{p o}$

$$
=47.235+25.787=73.022 \mathrm{kPa}
$$

Or

$$
\frac{73.022 \times 10^{3}}{10^{5}} \text { bar = } 0.7302 \text { bar. }
$$

2.5 A solution containing 30 g of a nonvolatile solute exactly in 90 g water has a vapour pressure of 2.8 kPa at 298 K . Further 18 g of water is then added to solution, the new vapour pressure becomes 2.9 kPa at 298 K . Calculate,
(i) Molecular mass of the solute
(ii) Vapour pressure of water at 298 K.

Sol. Moles of solute $\left(\mathrm{n}_{\mathrm{B}}\right)=\frac{30}{M}$; Moles of $\mathbf{H}_{2} \mathrm{O}\left(\mathrm{n}_{\mathrm{H}_{2} \mathrm{O}}\right)=\frac{90}{18}=5$

$$
\begin{align*}
x_{\mathrm{H}_{2} \mathrm{O}}=\frac{5}{5+30 / M} & =\frac{5 M}{30+5 M}=\frac{M}{6+M} \\
\mathbf{P}_{\text {sol }} & =\mathbf{p}^{\circ} \times \frac{M}{6+M} \text { or } \frac{M+p^{\circ}}{6+M}=\mathbf{2 . 8}
\end{align*}
$$

After adding $18 \mathrm{~g}(=1 \mathrm{~mol})$ of water to solution

$$
x_{\mathrm{H}_{2} \mathrm{O}}^{\prime}=\frac{6}{6+30 / M}=\frac{M}{5+M}
$$

Now,

$$
\begin{equation*}
p_{\text {sol }}^{\prime}=p^{\circ} \times \frac{M}{5+M} \quad \text { or } \quad \frac{M+p^{\circ}}{5+M}=\mathbf{2 . 9} \tag{ii}
\end{equation*}
$$

Now, divide (i) by (ii), $\frac{5+M}{6+M}=\frac{2.8}{2.9}$
or

$$
\mathrm{M}=23 \mathrm{~g} \mathrm{~mol}^{-1}
$$

Substitute the value of $M$ in (ii),

$$
\mathbf{p}^{\circ}=\frac{2.9 \times(5+\mathrm{M})}{\mathrm{M}}=\frac{2.9 \times 28}{23}=\mathbf{3 . 5 3} \mathbf{~ k P a} .
$$

2.6 Two elements $A$ and $B$, form compounds having molecular formula $A B_{2}$ and $A B_{4}$. When dissolved in 20 g of $\mathrm{C}_{6} \mathrm{H}_{6}, 1 \mathrm{~g}$ of $\mathrm{AB}_{2}$ lowers the freezing point by 2.3 K , whereas 1.0 g of $\mathrm{AB}_{4}$ lowers it by 1.3 K . The molal depression constant for benzenes is $5.1 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}$. Calculate atomic mass of $A$ and $B$.
Sol. We know, $\quad \mathbf{M B}_{\mathrm{B}}=\frac{1000 \times \mathrm{K}_{\mathrm{f}} \times \mathrm{W}_{\mathrm{B}}}{\mathrm{w}_{\mathrm{A}} \times \Delta \mathrm{T}_{\mathrm{f}}}$

$$
\begin{aligned}
\therefore \quad & \mathrm{M}_{\mathrm{AB}_{2}}=\frac{1000 \times 5.1 \times 1}{20 \times 2.3}=\mathbf{1 1 0 . 8 7} \mathbf{g ~ m o l}^{-\mathbf{1}} \\
& \mathrm{M}_{\mathrm{AB}_{4}}=\frac{1000 \times 5.1 \times 1}{20 \times 1.3}=\mathbf{1 9 6 . 1 5} \mathrm{g} \mathrm{~mol}^{-1}
\end{aligned}
$$

If $a$ and $b$ are respectively atomic masses of $A$ and $B$ then,

$$
\begin{array}{lll}
M_{A B_{2}}=\mathbf{a}+\mathbf{2 b} & \text { or } & \mathbf{a}+\mathbf{2 b}=\mathbf{1 1 0 . 8 7} \\
M_{A B_{4}}=\mathbf{a}+\mathbf{4 b} & \text { or } & \mathbf{a}+\mathbf{4 b}=\mathbf{1 9 6 . 1 5}
\end{array}
$$

Solving the simultaneous equations we have

$$
\mathrm{a}=25.58 \mathrm{u} ; \quad \mathrm{b}=42.64 \mathrm{u} .
$$

2.7 If density of some lake water is $1.25 \mathrm{~g} \mathrm{~mL}^{-1}$ and it contains 92.0 g of $\mathrm{Na}^{+}$ions per kg of water. Calculate the molality and molarity of $\mathrm{Na}^{+}$ions in lake.
Sol. $\quad$ Molality $=\frac{\text { Mol. of } \mathrm{Na}^{+} \text {ions }}{\text { Mass of water (kg) }}$

$$
=\frac{92(\mathrm{~g}) / 23\left(\mathrm{~g} \mathrm{~mol}^{-1}\right)}{1(\mathrm{~kg})}=4 \mathrm{~m}
$$

$$
\begin{aligned}
\text { Molarity } & =\frac{\text { Mol. of } \mathrm{Na}^{+} \text {ions }}{\text { Vol. of water (L) }} \\
& =\frac{92(\mathrm{~g}) / 23\left(\mathrm{~g} \mathrm{~mol}^{-1}\right)}{1000(\mathrm{~g}) / 1.25 \times 10^{3}\left(\mathrm{gL}^{-1}\right)} \\
& =\frac{92(\mathrm{~g}) \times 1.25 \times 10^{3}\left(\mathrm{~g} \mathrm{~L}^{-1}\right)}{23\left(\mathrm{~g} \mathrm{~mol}^{-1}\right) \times 1000(\mathrm{~g})}=\mathbf{5 M}
\end{aligned}
$$

2.8 If solubility product of CuS is $6 \times 10^{-\mathbf{1 6}}$, Calculate the maximum molarity of CuS in aqueous solution.
Sol.

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Cu}^{2+}\right]\left[\mathrm{S}^{2-}\right]=6 \times 10^{-6}
$$

Maximum molarity of $\mathrm{CuS}=$ Solubility of CuS
If $\mathrm{S} \mathrm{mol} \mathrm{L}^{\mathbf{- 1}}$ is solubility of $\mathbf{C u S}$

$$
\begin{aligned}
& S^{2}=6 \times 10^{-18} \text { or } \quad S=\left(6 \times 10^{-16}\right)^{1 / 2} \\
& S=2.45 \times 10^{-8} \mathrm{M} .
\end{aligned}
$$

2.9 Nalorphene ( $\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{NO}_{3}$ ), similar to morphine, is used to combat withdrawal symptoms in narcotic users. Dose of nalorphene generally given is $\mathbf{1 . 5} \mathbf{~ m g}$. Calculate the mass of $\mathbf{1 . 5}$ $\times 10^{-3} \mathbf{~ m}$ aqueous solution required for the above dose.

Sol.

$$
\begin{aligned}
\mathbf{m} & =\frac{W_{B} \times 1000}{(\mathrm{MM})_{B} \times W_{A}} \quad \text { or } \\
& =\frac{1.5 \times 10^{-3}(\mathrm{~g}) \times 1000}{311\left(\mathrm{~g} \mathrm{~mol}^{-1}\right) \times 1.5 \times 10^{-3}}=\mathbf{3 . 2 1 5} \mathbf{g}
\end{aligned}
$$

Mass of solution

$$
\begin{aligned}
& =\left(\mathrm{W}_{\mathrm{A}}+\mathrm{W}_{\mathrm{B}}\right)=3.215(\mathrm{~g})+1.5 \times 10^{-3}(\mathrm{~g}) \\
& =3.217 \mathrm{~g}
\end{aligned}
$$

2.10 Calculate the depression in the freezing point of water when 10.0 g of $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}(\mathrm{Cl})$ COOH is added to 250 g of water. $\mathrm{Ka}=1.4 \times 10^{-5} \mathrm{Kf}_{\mathrm{f}}$ for water $=1.86 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}$. The density of the solution is $0.904 \mathrm{~g} \mathrm{~mL}^{-1}$.

Sol. Calculation of molarity of the solution
Mass of solution $=\mathbf{2 5 0}+\mathbf{1 0}=\mathbf{2 6 0} \mathbf{g}$
Volume of the solution $=$ Mass $/$ density $=\frac{260(\mathrm{~g})}{0.904\left(\mathrm{~g} \mathrm{~mL}^{-1}\right)}=287.6 \mathrm{~mL}$
Molarity $=\frac{W_{B} \times 1000}{(M M)_{B} \times V}=\frac{10 \times 1000}{122.5 \times 287.6}$

$$
=0.284 \mathrm{~mol} \mathrm{~L}^{-1}
$$

Calculation of Vant Hoff's factor (i)
Let degree of dissociation of acid be $\alpha$

$$
\begin{aligned}
& \alpha=\sqrt{\mathrm{Ka} / \mathrm{c}}=\sqrt{\frac{1.4 \times 10^{-3}}{0.284}}=0.07 \\
& \alpha=\frac{i-1}{m-1}=\frac{i-1}{2-1}
