## RELATIONS \& FUNCTIONS

## KEY POINTS TO REMEMBER

- $\mathrm{A} \times \mathrm{B}=\{(\mathrm{a}, \mathrm{b}): \mathrm{a} \in A, b \in B\}$.
- If $n(A)=r, n(B)=s$ from set $A$ to $B$ then $n(A x B)=r$ \& no. of relations $=2^{\text {rs }}$.
- $\varnothing$ is a relation defined on set A ,called empty or void relation.
- $R=A x A$ is called universal relation.
- Reflexive relation : Relation $R$ defined on set $A$ is said to be reflexive iff (a, a) $\epsilon \mathrm{R} \forall$ $\mathrm{a} \in \mathrm{A}$.
- Symmetric Relation : Relation $R$ defined on set $A$ is said to be symmetric if $(a, b) \in R$, ( $\mathrm{b}, \mathrm{a}) \in \mathrm{R} \forall \mathrm{a}, b \in \mathrm{~A}$.
- Transitive Relation : Relation $R$ defined on set $A$ is said to be transitive if $(a, b) \in R$, ( $\mathrm{b}, \mathrm{c}$ ) $\in \mathrm{R}$ implies $(\mathrm{a}, \mathrm{c}) \varepsilon R \forall \mathrm{a}, b \in \mathrm{~A}$.
- Equivalence Relation: A relation R defined on set A is said to be equivalence relation iff it is reflexive, symmetric and transitive.
- One - One function: $\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}$ is said to be one - one if distinct elements in A has distinct images in B. i.e. $\forall \mathrm{x}_{1}, \mathrm{x}_{2} \in$ A s.t. $\mathrm{x}_{1} \neq \mathrm{x}_{2}$ this implies .f( $\mathrm{x}_{1} \neq f\left(\mathrm{x}_{2}\right)$

OR
$\forall \mathrm{x}_{1}, \mathrm{x}_{2} \in$ A s.t. $. \mathrm{f}\left(\mathrm{x}_{1}\right)=f\left(\mathrm{x}_{2}\right)$ implies $\mathrm{x}_{1}=\mathrm{x}_{2}$

- One-one function is also called injective function.
- Onto function (surjective): A function $\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}$ is said to be an onto iff $\mathrm{R}_{\mathrm{f}}=\mathrm{B}$ i.e. $\forall \mathrm{b} \epsilon$ B , there exist $\mathrm{a} \epsilon \mathrm{A}$,s.t. $\mathrm{f}(\mathrm{a})=\mathrm{b}$.
- Invertible function: A function $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is invertible iff it is bijective.
- Binary Operation: A binary Operation * defined on set A is a function from A x A $\rightarrow \mathrm{A}$. * $(\mathrm{a}, \mathrm{b})$ is denoted by $\mathrm{a} * \mathrm{~b}$.
- Binary operation is commutative and associative in nature.
- If $*$ is a binary operation on A , then element $\mathrm{e} \epsilon \mathrm{A}$ is said to be the identity element iff $\mathrm{a} * \mathrm{e}=\mathrm{e} * \mathrm{a} \quad \forall \mathrm{a} \in \mathrm{A}$.
- Identity element is unique.
- If $*$ is a binary operation on $A$, then element $b$ is said to be inverse of a $\epsilon \mathrm{A}$ iff $a^{*} b=b^{*} a=e$
- Inverse of an element if exists, is unique.
- Total number of binary operations on a set consisting of $n$ elements is $\boldsymbol{n}^{\boldsymbol{n}^{2}}$.
- Total number of binary commutative binary operations on a set consisting of $n$ elements is $\boldsymbol{n}^{\frac{n(n-1)}{2}}$.
- If $A$ and $B$ are two non empty finite sets containing $m$ and $n$ elements respectively, then (i) Number of functions from A to $\mathrm{B}=\boldsymbol{n}^{\boldsymbol{m}}$.
