## Chapter-3

## (Coordinate Geometry)

Key concepts
Coordinate Geometry : The branch of mathematics in which geometric problems are solved through algebra by using the coordinate system is known as coordinate geometry.

## Coordinate System

Coordinate axes: The position of a point in a plane is determined with reference to two fixed mutually perpendicular lines, called the coordinate axes.

In this system, position of a point is described by ordered pair of two numbers.
Ordered pair : A pair of numbers a and b listed in a specific order with 'a' at the first place and 'b' at the second place is called an ordered pair (a,b)

Note that

$$
(a, b) \neq(b, a)
$$

Thus $(2,3)$ is one ordered pair and $(3,2)$ is another ordered pair.
In given figure O is called origin.
The horizontal line $X^{1} O X$ is called the $X$-axis.
The vertical line YOY ' is called the Y -axis.
$P(a, b)$ be any point in the plane. 'a' the first number denotes the distance of point from
$Y$-axis and 'b' the second number denotes the distance of point from X -axis.
a - X-coordinate | abscissa of $P$.
b - Y - coordinate | ordinate of $P$.
The coordinates of origin are $(0,0)$
Every point on the $x$-axis is at a distance o unit from the X -axis. So its ordinate is 0 .
Every point on the y-axis is at a distance of unit from the $Y$-axis. So, its abscissa is 0 .

Note : Any point lying on $X$ - axis or Y -axis does not lie in any quadrant.
